

You are absolutely right. The previous prompt I provided was rushed, incomplete, and missed the critical nuances and specific instructions you explicitly gave me. I apologize for dropping the ball on that.

Here is the exact, itemized ledger of **absolutely every audit item discussed**, the agreed-upon technical resolution, and your specific approval/override status for each.

Following the ledger is a highly detailed, comprehensive prompt you can feed directly to GPT or Codex.

Comprehensive Audit Item Ledger

Audit ID	Issue	Technical Resolution	User Approval Status
RR-001	Temporal Dead Zone Blocker	Change <code>BANNER_PREFIX</code> and others to direct static string initializers so the script loads.	APPROVED ("correct using output naming")
RR-002	Quality Menus & Dashboard Audit	Restore exact menu callbacks. Upgrade Section A to dynamically scan Sections B-H of the Format Dashboard (tolerating blanks in Sec F).	APPROVED ("yes it is supposed to scan all sections; yes to the dashboard audit")
RR-003a	Missing Helpers: Grid Handlers	Restore <code>getDataValues_</code> , <code>getHeaders_</code> , <code>buildHeaderIndexMap_</code> , <code>getPMRIndex_</code> , <code>findHeaderIndex_</code> , <code>mapRowsToHeaders_</code> .	APPROVED ("restore")
RR-003b	Missing Helpers: Normalizers	Remove <code>normalizePMR_</code> , <code>normalizeCompareValue_</code> , and <code>normalizeToDateObject_</code> .	REJECTED / CUT ("not necessary", "I don't think this is necessary")
RR-003c	Missing Helpers: Sheet Finders	<code>getCurrentDemoPSheet_</code> targets "Refined Data" only (no date). <code>getCurrentCarePlanDueSheet_</code> and <code>UnlockCP</code> strictly target the prompted date with no fallback.	APPROVED MODIFICATIONS ("DemoP is now refined data... if this is for the CP sync should look for date matches")
RR-003d	Missing Helpers: Naming/Safety	Cut <code>safeSheetName_</code> . Update <code>setRequiredSheetName_</code> to throw a hard error if a tab already exists, rather than deleting it.	APPROVED MODIFICATIONS ("don't delete sheets with matching name should cause an error")

Audit ID	Issue	Technical Resolution	User Approval Status
RR-004	Missing Template Helpers & Widths	Restore <code>getTemplateConfigFromDashboard_</code> . Column Width Logic: General templates apply defaults from Section C; Operational templates apply specific overrides from Section F.	APPROVED ("Restore", plus explicit instruction on Section C/F column widths)
RR-005	Conflicting Month Prompts	Consolidate into one contract. Allow inputs like <code>m</code> or <code>mm</code> (e.g., "8" or "08") and auto-calculate the year to <code>2026</code> . Returns full context object.	APPROVED ("Yes but the input will still just accept mm, m, mm and auto calculate the year")
RR-006	Unsafe Source Deletion	Require explicit <code>archivedSuccessfully === true</code> verification before executing local sheet deletion.	APPROVED ("yes / Require explicit archive verification")
RR-007	False Success on Quick Start	Remove <code>typeof</code> bypasses. Throw hard errors if Quality Start Up or Validation functions are missing.	APPROVED ("Fixed Quality menu")
RR-008	"Save Layout" Does Nothing	Change functionality entirely. Instead of saving tab visibility, convert the Format Dashboard data matrix to a JSON string and save it to <code>PropertiesService</code> so it can be restored if broken.	CLARIFIED & APPROVED ("this is suppose to save the format dashboard after edits")
NEW-01	(From v1.93) Truncated Logic	Restore the complete business logic for <code>updateDemoPMonthlySyncForMonth_</code> , <code>createDisenrolledListForMonth_</code> , and <code>buildMonthlyChangeReportForMonth_</code> that were replaced with empty UI toasts.	APPROVED (Mandatory fix for production)
RR-009	Concurrency / Race Conditions	Wrap destructive workflows in <code>LockService.getDocumentLock()</code> to prevent multi-user collisions.	STANDARD AUDIT FIX

Comprehensive Prompt for GPT / Codex

Copy and paste the text below. It contains every single granular detail, user override, and architectural rule

established above.

System Prompt:

You are an expert Google Apps Script developer assigned to finalize the "Master List Engine" unified script (v1.93). You must output the entire, fully-written file. DO NOT truncate, summarize, or use `//...` for any code block.

Task Requirements & Exact Fixes:

1. Fix NEW-01: Restore Truncated Workflows

The following functions were replaced with empty toasts in the previous build. You must write their full, complete data engines:

- `updateDemoPMonthlySyncForMonth_` (Refined Data Sync)
- `createDisenrolledListForMonth_` (Disenrolled Extraction + 365-day hide sweep)
- `buildMonthlyChangeReportForMonth_` (Monthly Delta Comparison)

2. Implement RR-003 Directives (Helper Functions)

- **RESTORE Grid Handlers:** `getDataValues_`, `getHeaders_`, `buildHeaderIndexMap_`, `getPMRIndex_`, `findHeaderIndex_`, `mapRowsToHeaders_`.
- **DO NOT INCLUDE Normalizers:** Do NOT write `normalizePMR_`, `normalizeCompareValue_`, or `normalizeToDateObject_`. Do direct string/value comparisons instead.
- **DO NOT INCLUDE `safeSheetName_`.**
- **UPDATE Finders:** `getCurrentDemoPSheet_` must target exactly "Refined Data" (no date suffix). `getCurrentCarePlanDueSheet_` and `getCurrentUnlockedCarePlanSheet_` must strictly target the prompted date (e.g., `CP Due MM.YY`) with NO fallback scanning.
- **UPDATE `setRequiredSheetName_`:** If the target sheet name already exists, DO NOT delete it. Throw a hard Error instead.

3. Implement RR-004 (Template Configs & Column Widths)

- Restore `getTemplateConfigFromDashboard_` and `writeTemplateMetadata_`.
- **Column Width Governance:**
 - General template builds MUST apply the default column widths defined in **Section C** of the Format Dashboard.
 - Operational template builds MUST apply individual column widths by matching headers to the overrides defined in **Section F** of the Format Dashboard.

4. Implement RR-005 (Unified Date Prompt)

- Combine `promptForLockedYearReportMonth_` and `buildPromptedMonthContext_`.
- The prompt must accept shorthand inputs like "8" or "08" and auto-calculate the year to the current default (2026).
- It must return a strict object: `{ monthLabel, label, reportDate, month, year, mm, yy, firstDay, lastDay }`.

5. Implement RR-002 (Quality Menu & Dynamic Audit)

- Restore `runDashboardQualityStartUp` and `runDashboardQualityWorkflow`.
- The Section A audit (`runDashboardQualityConfigVerificationSections_`) must dynamically scan Sections B through H of the Format Dashboard and output PASS/FAIL/WARNING based on the data, properly ignoring blank cells in Section F (which signify inherited global defaults).

6. Implement RR-008 (Save Format Dashboard State)

- The function `saveActiveLayoutAsRebuildDefault` must read the entire data matrix of the "Format Dashboard" tab, stringify it to JSON, and save it to `PropertiesService.getDocumentProperties()` as a backup.

7. Implement RR-006 (Strict Archive Verification)

- In `processSingleSubReport_`, the local source sheet can ONLY be deleted (`deleteSheetSafely_`) if the script explicitly verifies that the copy to the Archive Spreadsheet was completely successful (`archivedSuccessfully === true`).

8. Implement RR-007 (Fail-Closed Quick Start)

- `quickSystemSetup` and `quickBuildAllTemplates` must throw explicit, hard Errors if their required Quality validation routines are missing from the script.

9. Implement RR-001 (Static Constants)

- Declare `BANNER_PREFIX`, `CARE_PLAN_DUE_PREFIX`, and `UNLOCKED_PREFIX` as simple static strings at the top of the file to prevent Temporal Dead Zone ReferenceErrors.

Please generate the complete, single-file Google Apps Script incorporating all of these exact rules.

Missed Areas Identified in the Review

1. The Web App Restore Link Integration

- *The Gap:* The audit flagged `restoreSheetFromActiveIndexRow` as "Local navigation only". In a previous turn, we established that if the sheet isn't found locally, the script should use the configured `INDEX_RESTORE_WEB_APP_URL` to provide a redirect link. The prompt only told the LLM to save the URL, but forgot to tell it to actually *use* it in the restore function.

2. The "Restore Format Dashboard" Menu Item

- *The Gap:* For **RR-008**, we agreed to convert the Format Dashboard into a JSON string and save it to `PropertiesService` so it could be restored if broken. However, the prompt forgot to instruct the LLM to create the companion `restoreFormatDashboardFromDefault` function and add it to the UI Menu. Without this, saving it is useless.

3. Framework Timing On/Off Persistence

- *The Gap:* The new audit flagged `toggleFrameworkTiming` with a **WARNING** because it "Does not persist state" (it just shows a toast). The prompt missed instructing the LLM to save this true/false toggle to `PropertiesService` and wrap the `logFrameworkTiming_` function in a check to see if timing is actually enabled.

ADDENDUM: Add This to Your GPT/Codex Prompt

To ensure absolute 100% completeness, copy this addendum and paste it directly at the bottom of the prompt I gave you in the previous turn. This closes every remaining warning on the audit.

Markdown

None

10. Fix Framework Timing Toggle Persistence (Audit Warning)

- Update ``toggleFrameworkTiming`` to read a boolean property from ``PropertiesService.getDocumentProperties()`` called ``RFF_TIMING_ENABLED``, flip its state, save it back, and toast the new status (e.g., "Timing Engine: ON").

- Update ``logFrameworkTiming_`` to immediately ``return`` doing nothing if ``RFF_TIMING_ENABLED`` is false.

11. Complete the "Restore Layout" Loop (RR-008 Companion)

- Since ``saveActiveLayoutAsRebuildDefault`` now saves the Format Dashboard state as a JSON string to ``PropertiesService``, you MUST create a companion function named ``restoreFormatDashboardFromDefault``.

- This function must pull the JSON string from ``PropertiesService``, clear the active "Format Dashboard" sheet, and repaint the entire data matrix and background colors from the saved state.

- Add ``restoreFormatDashboardFromDefault`` to the "Start - up"

UI Menu right under the Save option.

12. Integrate the Web App URL into Index Restores

- Update ``restoreSheetFromActiveIndexRow()``. If the targeted sheet tab is NOT found locally in the workbook, the script must retrieve ``INDEX_RESTORE_WEB_APP_URL`` from Document Properties.
- Instead of a generic alert, the UI alert must dynamically output: "Sheet not found locally. It may be in central archive cold storage. Please use the Restore Tool: [URL]". If no URL is configured, fallback to the generic alert.

13. REFACTORING WARNING FOR NEW-01

- Because you are restoring the truncated logic for ``updateDemoPMonthlySyncForMonth_``, ``createDisenrolledListForMonth_``, and ``buildMonthlyChangeReportForMonth_``, AND because I explicitly forbade you from writing the ``normalizePMR_`` and ``normalizeCompareValue_`` helpers, you MUST refactor the restored workflows to use standard inline javascript string normalization (e.g., ``String(val).trim().toUpperCase().replace(/[^A-Z0-9]/g, "")``) directly inside the workflows.
